

Armada works to make Relativity archival jobs quick and easy.

Whether preparing for a migration, downsizing a server, or taking recurring backups of important cases, archiving workspaces can take up a lot of valuable time. Armada effectively balances system resources while avoiding any manual jobs that may be kicked off. Also, Armada can run 24/7 to ensure archival work completes as quickly as possible.

How Armada Works

1. Select a prioritized set of cases to archive.
2. Run Armada to kick off the set.
3. Get back to better things!

Benefits

- Reduces the amount of time spent defining ARM Archive jobs
- Eliminates the need to monitor system load or use ARM's manual scheduling as a prerequisite for enqueueing additional ARM Archive jobs
- Automates pre and post archive tasks necessary to archive a case, e.g., remove user access, hide a workspace from a view, delete the DB, etc.

Features

- Archives an unlimited number of prioritized workspaces without concern for overloading ARM
- Allows scripts to be configured to automatically execute before an archive begins or after an archive has completed
- Option of automatic retry function for transient errors as well as enhanced archive status reporting

Armada's Migration Dashboard provides a view of workspaces the tool is managing.

Why Milyli's Custom Dev Technologies?

Technologies like Armada function as “starter” frameworks that decrease delivery time and end costs, while adhering to the highest standards of functionality, reliability, usability, and efficiency. With a team that has over 125K+ hours developing on top of Relativity, Milyli can tackle any challenge professionals face when managing sensitive information and documents.
