

vdisccovery enhances its Relativity hosting with the **BatchGuru** tool collection, enabling users to easily perform technical tasks that are usually time consuming and often reserved for tech support teams. **BatchGuru** is a collection of tools that extends Relativity's functionality. Time-saving tools allow you to format dates, create custom hash values, convert a document's time zone, export native files in bulk and much more. **BatchGuru** brings consistency and ease of use that can be shared by the whole team, from tech-savvy analysts to busy attorneys. Built on top of Relativity, **BatchGuru** is infinitely customizable in your Relativity environment. All aspects of **BatchGuru** have security features and controls built in to guarantee the highest level of data integrity. **BatchGuru** is highly scalable to meet the demands of growing data sets.

powerful features

BEG-END TO LIST

Converts BegDoc and EndDoc fields to a sequential list of Bates numbers and writes it to a new field that list every page of the document to facilitate easy tagging or searching.

PRODUCTION EXPORTER

Allows exports to run distributed on multiple servers, eliminating the need to remote into a station to start the process. This saves a significant amount of time when handling large productions.

TIME-ZONE CONVERTER

Converts the date/time value from one time zone to another to account for data inconsistency or to improve review efficiency.

NATIVE FILE EXPORTER

Allows the end user to quickly export sets of native files as a ZIP container without using Relativity's desktop client and allowing for PC and Mac compatibility.

SORT DATE

Takes the date of a parent email and applies it to all of its attachments so families of documents can be sorted chronologically.

MD5 HASH GENERATOR

Allows for the generation of new hash values - based on the fields of your choice, to facilitate customized deduplication.

PRODUCTION HELPER

Allows the end user to update fields required by SEC, DOJ, or others in 1 click with the use of saved presets, eliminating the requirement of multiple tools.

EMAIL HEADER PARSER

Extract various metadata that processing software does not extract. This tool offers **vdiscovery** a distinct advantage when dealing with Gmail collected data that stores folders/labels in email headers.

REMOVE EMAIL ADDRESS

Removes email addresses from the sender or recipient fields, leaving only names, to make exported reports or privilege logs easier to read.

PARENT ID/ATTACH IDS

Enables the user to create Summation-compatible DAT files that can be exported directly from the Relativity interface.

TAG AS DOCUMENT OR ATTACHMENT

Identifies which record is a parent and which is a child based on a group identifier so that the filter option in a view can be used to display specific documents.

OTHERPROPS

Extracts any one of the fields from the OtherProps container, created by Relativity Processing, into a new field to enable easy sorting and searching.
